## PART III.

### *1.—The Text Re-arranged.*

Quotations in the text are distinguished by daggers† . . . . . †, and abbreviations by ° superscribed. Asterisks attached to numbers denote change-ratios (See § 103). In the foot-notes angular crotchets < > indicate that the portion enclosed formed part of the argument or was implied in the original text, but is now missing.

On pp. 13 and 14 of Part I are tables equating the Bodleian Library order with the revised arrangements.

The notes attached to the revised arrangement are very crude and are presented with considerable diffidence; but they are the result of much labour and will possibly save the student of the MS a good deal of spade work.

G. R. K.

---

Owing to Mr. Kaye's unfortunate death, the last proofs of this part have been prepared for the press by Mr. K. N. Dikshit, Deputy Director General of Archaeology for Exploration, who has also made a few emendations.

[38-40.] Plates xxvi and xxvii exhibit some sixteen fragments all placed out of order. Some of these have now been pieced together. (See the illustration facing page 4.)

This grouping is not final because some of the fragments consist of portions of two or more leaves stuck together, and until these are separated no exact order can be achieved.

We should naturally expect the first leaves of the manuscript to be comparatively more damaged than those in the middle of the book, and the 'find order' and the writing indicate that these fragments are probably portions of early leaves; but neither of these criteria is rigorous and it is quite possible that we have placed the fragments in their wrong places.

[38-40 recto.] These fragments appear to relate to a geometrical problem concerning an area whose width (*vaipulya*) is increased.

[38-40 verso.] A fragment of a problem connected with the area of a circle or the surface (*ṭala*) of a sphere. The phrase *esha vāhasya kīṇḍa pramāṇam* ought to be illuminating but is not. The change-ratio 64 is possibly connected with a "square measure." See Part I §108(b). The number 6210 = 3<sup>2</sup>·230 is said to be the product of certain quantities.

4	5	6
4	5	6
4	5	6

kuru prakshepakam tata praksh

A 3. [38-40 recto.] See the plate facing page 4. The meaning is not clear, but  $x(x+y+z)=60$   
 $y(x+y+z)=75$   
 $z(x+y+z)=90$   
whence  $(x+y+z)^2=225$  and  $x+y+z=15$ . The answers are  $x=4$ ,  $y=5$ ,  $z=6$ .  
The writing is classed as  $\alpha_2$ .

[54.] Folio 54 possibly consists of two leaves, or rather fragments of them, for there are ten pieces. The writing on the two sides differs—that on 54<sup>recto</sup> may be classed as  $\alpha_1$  and that on the left side as  $\alpha_2$  and in this respect the leaf resembles fol. 35<sup>b</sup>. There is a characteristic *ye* at the bottom of 54<sup>b</sup> verso which is also found on 29<sup>b</sup> recto et verso.

[54<sup>a</sup> verso.] Seems to contain portions of a *sūtra*, an example and solution. The phrase *dviguṇam cha tṛi-ūna* seems to be referred to on fol. 35<sup>a</sup> recto but there we have *tryūna* with a particularly noteworthy conjunct *tryū* (see table IV, 5 part ii). The term *hastag(alam)* on 54<sup>b</sup> recto (not necessarily connected with 54<sup>a</sup>) occurs only once more on fol. 1<sup>a</sup> recto.

[54<sup>a</sup> recto.] The phrase *tayor yogaviyo* also occurs on fol. 35<sup>b</sup> verso.

## A 5.

 yutam nyāsa

5. [35<sup>b</sup>.] The writing is different on the two sides ( $\alpha_1$  and  $\alpha_2$ ) and possibly the fragment is a portion of two leaves stuck together. The phrase *bhājītā puruṣa* . . . occurs on 51<sup>b</sup> recto.

## A 6.

bhājita hitvā | tatrottarā 1 | 1 | yutam  $\begin{array}{|c|} \hline 2 \\ \hline \end{array}$  |  $\begin{array}{|c|c|c|} \hline 1 & 3 & 3 \\ \hline 4 & 2 & 1 \\ \hline \end{array}$  . . . 51<sup>b</sup> recto.

9 | . eshā ϕ . itha bhājita | purushah  $\begin{array}{|c|} \hline 1 \\ \hline 4 \\ \hline \end{array}$  |  $\begin{array}{|c|} \hline 3 \\ \hline 2 \\ \hline \end{array}$  |  $\begin{array}{|c|} \hline 3 \\ \hline 1 \\ \hline \end{array}$  | eshām sadṛiṣe 35<sup>a</sup> recto.

$\begin{array}{|c|} \hline 4 \\ \hline 19 \\ \hline \end{array}$  | dhanam |  $\begin{array}{|c|} \hline 19 \\ \hline 1 \\ \hline \end{array}$  | anena guṇitaṁ jātam |  $\begin{array}{|c|} \hline 4 \\ \hline \end{array}$  | esha prathamasya dhanam

guṇam  $\begin{array}{|c|} \hline 21 \\ \hline \end{array}$  | dvi-guṇam  $\begin{array}{|c|} \hline 42 \\ \hline \end{array}$  | try-ūnam  $\begin{array}{|c|} \hline 39 \\ \hline \end{array}$  | eshaḥ nyāsaḥ

pratya . . . . . daśam agravṛindānām chatur-daśa ekonachatvāriṁśa | tat

pād-ārdha tri-bhāgā . . . . .

$\begin{array}{|c|} \hline 4 \\ \hline \end{array}$  |  $\begin{array}{|c|} \hline 1 \\ \hline 4 \\ \hline \end{array}$  | pha° 4 | .evam di° 21 | esha prashṇa etair . . .

[51<sup>b</sup> and 35<sup>a</sup> recto.] The position is uncertain but the writing is of the α<sub>2</sub> style and there are slight indications of connexion with folio 54. Fol. 35<sup>b</sup> is in α<sub>1</sub> writing. See the plate facing page 4. (Read 51 recto B, not verso.)

The fragmentary contents are not clear. We have  $1+1=2$ ;  $\frac{1}{2}+\frac{1}{2}+3=\frac{13}{2}$ ;  $\frac{10}{10/4}=4$  and  $\frac{2.3.(12+2)}{2}-3=39$

Apparently a fragment of the *sūtra* on which the solution depends is preserved on fol. 54<sup>a</sup> verso, but the evidence, consisting of the phrase *dviguṇam cha try-ūna*, is slender.

udā || . . . . . | 6 | . . . . . yoga 111 śeshā ϕ 51<sup>b</sup> verso.

purusha bhājita purushah  $\begin{array}{|c|} \hline 1 \\ \hline 4 \\ \hline \end{array}$  |  $\begin{array}{|c|} \hline 1 \\ \hline 6 \\ \hline \end{array}$  |  $\begin{array}{|c|} \hline 1 \\ \hline 5 \\ \hline \end{array}$  | eshām sadṛiṣhe yutim kṛitvā yutā  $\begin{array}{|c|} \hline 37 \\ \hline 60 \\ \hline \end{array}$  | 35<sup>a</sup> verso.

bhājita  $\begin{array}{|c|} \hline 60 \\ \hline 37 \\ \hline \end{array}$  | . . . . . esha gavāśva mahishī pratyaika śāleshu bhāga . .

$\begin{array}{ c } \hline 1 \\ \hline 1 \\ \hline \end{array}$ śā°	$\begin{array}{ c } \hline 180 \\ \hline 1 \\ \hline \end{array}$ gā°	$\begin{array}{ c } \hline 1 \\ \hline 4 \\ \hline \end{array}$	phalaṁ 45 . . . . .

[51<sup>b</sup> & 35<sup>a</sup> verso.] The writing is of the α<sub>2</sub> class. The 'find order' of folio 51 is 37 while that of 35 is not known. The position is very uncertain. What remains of the problem is

$\frac{1}{2}+\frac{1}{2}+\frac{1}{2}=\frac{3}{2}$  111× $\frac{3}{2}$ =180  
 1 enclosure : 180 cows :  $\frac{1}{2}$  : 45 1 subtract 6=39.

1	2	2	2	2	

7. [51<sup>a</sup>.] Either there are two leaves stuck together here or there is some over-lapping. The writing on both sides is α<sub>2</sub>. The find order is 37.

[51<sup>a</sup> recto.] i. There is not enough material for reconstruction but  $x+(x+1)+(x+2)+(x+3)=54$  therefore  $4x=54-6$  and  $x=12$  is indicated.

ii. A certain Rāja makes presents to 57 wise men, etc. See 52 recto.

[51<sup>a</sup> verso.] This apparently does not connect up with the other side. It exhibits the solution of an example which may be expressed by

$$t_1 + 3t_1 + 3^2t_1 + 3^3t_1 + 3^4t_1 + \frac{3}{2}t_1 + \frac{3}{2}(t_1 + t_2) + \frac{3}{2}(t_1 + t_2 + t_3) + \frac{3}{2}(t_1 + t_2 + t_3 + t_4) \} = 329$$

Set  $t_1=2$  then the first series becomes 242 and the second 87 and the combined series is  $2 + \frac{3}{2} + \frac{3}{2} + \frac{1}{2} + \frac{1}{2} = 329$ . See also page 47.

\* Omitted in the MS.

[52 recto.] i. The writing on both sides is  $\alpha_2$  and exhibits examples of the 'sickle-shaped' medial  $\bar{\imath}$  and  $\bar{\iota}$ . The 'find order' is 57. It is possible that 52 recto gives parts of the solution of the example on 51 recto which would make that page the reverse, but I doubt the connexion. What is left of the solution means

$$x(\frac{1}{10} + \frac{1}{5} + \frac{1}{4}) = 57 \quad \text{or} \quad x\frac{10}{20} = 57 \quad \text{and} \quad x = 120. \quad \text{A proof by the 'rule of three'}$$

$$1 : 120 :: \frac{1}{10} : 12$$

$$1 : 120 :: \frac{1}{5} : 15$$

$$1 : 120 :: \frac{1}{4} : 30$$

ii. The example, which is continued on 52 verso, may be expressed by  $x(1 - \frac{1}{2})(1 - \frac{1}{4})(1 - \frac{1}{5}) = x - 280$  whence  $x = \frac{280}{\frac{28}{320}} = 400$ . A proof follows:  $\frac{400}{2} = 200$  and  $400 - 200 = 200$ ;  $\frac{200}{4} = 50$  and  $200 - 50 = 150$ ;  $\frac{150}{5} = 30$  and  $150 - 30 = 120$ ; and  $400 - 120 = 280$ .

Again  $\frac{1}{2} + \frac{1}{4} (1 - \frac{1}{2}) + \frac{1}{5} (1 - \frac{1}{4})(1 - \frac{1}{5}) = \frac{1}{2} + \frac{1}{8} + \frac{1}{40} = \frac{20}{40}$  and  $280 \times \frac{20}{40} = 400$ .

9. [29.] Folio 29 consists of six fragments, of which only the four larger ones need be considered at present. The correct order is *d, b, c*. Fragment *b* fits under *d* and *c* under *b* while *a* goes with folio 27. See the plate facing page 4.

[29 *d, b, c recto.*] The problem and its solution here partly preserved may be represented by  $x_1 + x_2 = 13$ ,  $x_2 + x_3 = 14$ ,  $x_3 + x_1 = 15$ . If  $x_1 = 5$  then  $x_2 = 8$ ,  $x_3 = 6$  and  $x_3 + x_1 = 11$  and the correct values are found from  $x_1 = 5 + \frac{15-11}{2} = 7$ ,  $x_2 = 13 - 7 = 6$ ,  $x_3 = 16 - 7 = 9$ . The phrase "śodhayet kramāt" recurs in the next example and is a quotation from a lost *sūtra*.

[29 *d, b, c verso.*] The example here given (continued on folio 27 verso) is formulated with exactly the same phraseology as the previous one. It may be represented by

$x_1 + x_2 = 16$ ,  $x_2 + x_3 = 17$ ,  $x_3 + x_4 = 18$ ,  $x_4 + x_5 = 19$ ,  $x_5 + x_1 = 20$ . If  $x_1 = 10$ ,  $x_2 = 6$ ,  $x_3 = 11$ ,  $x_4 = 7$ ,  $x_5 = 12$  and  $x_5 + x_1 = 22$

Therefore the correct value of  $x_1$  is  $10 + \frac{20-22}{2} = 9$ ,  $x_2 = 7$ , etc.

The phrases *ichchhā* . . . and *śodhayet kramāt* are quotations from a lost *sūtra*.

A 10. [27 verso] gives the answer of the problem given on fol. 29 verso, namely  $x_1=9$ ,  $x_2=7$ ,  $x_3=10$ ,  $x_4=8$ ,  $x_5=11$ , and the sums of the pairs are 16, 17, 18, 19, 20. (For general discussion see § 78, Part I.)

[27 recto.] Solution of a lost problem which may have been  $xy-3x-4y+1=0$  of which solutions are:  $x = \frac{3 \cdot 4 - 1}{7} + 4 = 15$ ,  $y = 3 + 1 = 4$ ;  $x = 4 + 1 = 5$ ,  $y = \frac{3 \cdot 4 + 1}{1} + 3 = 16$ . The quotations are from a *sūtra* very much like the one that follows.

The phrase *prithak rūpam vinikshipya* 'having added unity in each case' appears to be a quotation from a lost *sūtra*.

[29a] is wrongly placed on plate XX. It should come directly under 27, for of the letters —*evam sarvatra kārayet*, the top portions are on 27 verso and the bottom on 29a recto.

The writing is classed as  $\alpha_2$ .

A 11. [1 recto.] The position is uncertain. The 'find order' (33) places this leaf next to the fragments of folios 27, 29, 38, 39, 40. The writing is  $\alpha_a$  (there is a 'sickle'  $\alpha$ ). The numbered *sūtras* seem to place the leaf fairly early but they are not a very safe criterion. Note (ii) below seems to connect folios 1 and 27.

(i) Nothing intelligible. It ends the earliest numbered *sūtra* preserved.

(ii) I have not yet made out the meaning of this *sūtra*. Compare the opening phrase with the quotation on 27 recto. The metre is irregular. The reference to the second leaf is possibly to folio 27.

(iii) The *sūtra* means change  $\frac{a}{b}$  to  $\frac{b}{b-a}$  and quotations from it are given on folios 1 verso and 2 verso.

(iv) The example is solved on 1 verso and 2 recto and appears to have been somewhat as follows:

The combined capitals of five merchants less one-half of that of the first, one-third that of the second, one-fourth that of the third, one-fifth that of the fourth, or one-sixth that of the fifth is equal to the cost of a jewel. Find the cost of the jewel and the capital of each merchant.

A 11. [1 verso.] This appears to give part of the solution and proofs of the question on 1 recto. Since  $\sum x - \frac{1}{2}x_1 = \sum x - \frac{1}{3}x_2 = \sum x - \frac{1}{4}x_3 = \sum x - \frac{1}{5}x_4 = \sum x - \frac{1}{6}x_5 = c$ , we have  $\frac{1}{2}x_1 = \frac{2}{3}x_2 = \frac{3}{4}x_3 = \frac{4}{5}x_4 = \frac{5}{6}x_5 = k >$  whence  $\sum x = \frac{120+90+80+75+72}{60} = \frac{437k}{60} = \frac{437c}{437-60}$ .

If  $k=60$  then  $c=377$  and  $x_1=120$ ,  $x_2=90$ ,  $x_3=80$ ,  $x_4=75$ ,  $x_5=72$ .

Then follows a 'proof' which may be expressed by

$$\begin{array}{rcl}
 90+80+75+72=317 & \text{and} & 317+\frac{120}{2}=377 \\
 120+80+75+72=347 & \text{,,} & 347+\frac{90}{3}=377 \\
 120+90+75+72=357 & \text{,,} & 357+\frac{80}{4}=377 \\
 120+90+80+72=362 & \text{,,} & 362+\frac{75}{5}=377 \\
 < 120+90+80+75=365 & \text{,,} & 365+\frac{72}{6}=377 >
 \end{array}$$

† Compare with *sūtra* 11 on 1 recto.

		1463	1463	1463				

eshām yutiṁ kṛiyate . . . . . jātā | 2558 | chchheda projjhyam 1095 etan

maṇi mūlyam

A 12. ii. This is possibly the question solved on 2 verso.

[2 verso.] The general meaning is: since  $x_2 + x_2 - (\frac{1}{2} + \frac{1}{2})x_1 = x_1 + x_3 - (\frac{1}{2} + \frac{1}{2})x_2 = x_2 + x_1 - (\frac{1}{2} + \frac{1}{2})x_3 = 0$ , or  $\Sigma x - (1 + \frac{1}{2})x_1 = \Sigma x - (1 + \frac{1}{2})x_2 = \Sigma x - (1 + \frac{1}{2})x_3 = c$ , whence  $\frac{1}{2}x_1 = \frac{1}{2}x_2 = \frac{1}{2}x_3 = \Sigma x - c$  and  $\frac{\Sigma x}{\Sigma x - c} = \frac{1}{\frac{1}{2}} + \frac{1}{\frac{1}{2}} + \frac{1}{\frac{1}{2}} = \frac{924 + 836 + 798}{1463}$ . Setting  $\Sigma x - c = 1463$  we have  $x_1 = 924$ ,  $x_2 = 836$ ,  $x_3 = 798$ ;  $\Sigma x = 2558$  and  $c = 1095$  'which is the price of the jewel.'

I do not, however, understand the form of the first statement; but see fol. 65 verso where  $\frac{83}{42}$  means  $\frac{83 \cdot 7 + 49}{42}$ .

†amśām viśoddhya and kuryātat parivartanam are quotations from sūtra 11 on fol. 1 recto.

## A 13.

prithag dhanam tu vaṇijām mūlyam vā prāṇinām prithak

yadi . . . . . vaktum tato me chchhindhi saṁsayah ||

A 13. [3 verso.] Writing  $\alpha_2$ . Note the looped medial  $c$  in the penultimate line. Possibly a double leaf. 'Find order' 49. The position is determined only by the writing and the numbered sūtras on the reverse. Example: One possesses 7 horses ( $a^\circ = asva$ ), another 9 horses ( $ha^\circ = haya$ ) and a third 10 camels ( $\tilde{a}^\circ = ūshṭra$ ). Each gives one of his animals to both the others (and then their possessions are of equal value). It is required to find the capital of each merchant or the price of each animal. If thou art able, solve me this riddle.

We have  $(7-2)x_1 + x_2 + x_3 = (9-2)x_2 + x_3 + x_1 = (10-2)x_3 + x_1 + x_2 = c$  or  $\Sigma x - (7-3)x_1 = \Sigma x - (9-3)x_2 = \Sigma x - (10-3)x_3$ , whence  $4x_1 = 6x_2 = 7x_3 = k$  and  $\Sigma x = \frac{42+29+21}{163}k$ . If  $k=168$  then  $x_1 = \frac{168}{4} = 42$ ,  $x_2 = \frac{168}{6} = 28$ ,  $x_3 = \frac{168}{7} = 24$ . Also  $7x_1 = 294$ ,  $9x_2 = 252$ ,  $10x_3 = 242$  are the original capitals, and  $c = 262$ .

Mahāvīra gives the following example.

Rule.—The number of gems to be given away is multiplied by the total number of men. This product is subtracted from the number for sale: the continued product of the remainders gives rise to the value of the jewel provided the remainder relating to it is given up.

Example.—The first man had 6 sapphires, the second had 7 emeralds and the third 8 diamonds. Each by giving to each the value of a single stone became equal (in wealth to the others). Answer. 20, 15, 12.

chatur-daśama sūtraṃ 14

iii. sūtraṃ || gatisyaiva viśeṣhaṃ cha vibhaktāṃ pūrva gaṃtunāḥ

tenaiva kālāṃ bhavati stha . . . . kena tu ||

iv. udā° || addhyardha yojana gate śata . . . . .

. . . . .

A 13. [3 recto.] This is the reverse because sūtra 15 obviously begins a new section (B).

i. This appears to be a companion example to that on 3 verso. The abbreviations are possibly *ya°* for *yava* 'barley,' *go°* for *godhūma* 'wheat,' *sā* for *sālī* 'rice.' Here  $(4-2) x_1 + x_2 + x_3 = (5-2) x_2 + x_3 + x_1 = (6-2) x_3 + x_1 + x_2 = c$  whence  $x_1 = 2x_2 = 3x_3$  and  $x_1 = 6, x_2 = 3, x_3 = 2$  and  $c = 17$ .

ii. Not understood. The reference to the seventh leaf is now only tantalising. No recognisable quotations from the sūtra are preserved. The phrase *tāvat* . . . . *yāvat* 'so much . . . . as much' does not recur anywhere. In Bhāskara *tīvat* and *yīvat* (*tā°* and *yī°*) are used as algebraic quantities.

iii. The rule means  $t = \frac{r_1 D}{r_1 - r_2}$ , where  $r_1$  and  $r_2$  are rates of progress and  $D$  is a given time. (See § 83, Part I.) The rule is quoted on 4 recto where *gatisyaiva viśeṣhaṃ cha* and *pūrva gata* occur.

ha	10	haya lagna rathasya	5	gantavyo yojana	100
	1		1		1

†hayor vibhajya gantavyam† tatra hayā | 10 | gantavyam yo° | 100 | †ato

B 1. [8 recto.] The position of folios 8, 9 and 7 is very doubtful. They fit in nowhere perfectly. Their find orders are 48, 43 and 45; but 7 recto indicates that this find order is not of much value here. See the notes on fol. 7 verso. The writing is α4.

i. The rule is another variation of that given on 7 verso and means  $t = \frac{2A-2a}{d} + 1$  where  $A$  is a fixed rate and  $t = ((t-1)\frac{d}{2} + a)t$ .

ii. The example is  $A=10$ ,  $a=2$ ,  $d=3$  whence  $t = \frac{2 \cdot 10 - 2 \cdot 2}{3} + 1 = 6\frac{1}{3}$  and  $s = \frac{1 \cdot 90}{3} = 63\frac{1}{3}$ .

The phrase *dviguṇaṃ prabhavaṃ śuddhā* is quoted from the *sūtra* above; while the phrase *uttarārdheṇa bhājayet* was wrongly quoted and was afterwards cancelled: Compare with the *uttarārdheṇa bhājitam* quoted on 7 verso.

B 1. [8 verso.] i. The *sūtra* is partially reconstructed from the quotations in the solution below.

ii. The example is: There are ten horses of which five are yoked at a time to the chariot. How many changes should there be in a journey of one hundred *yojanas* and how much will each horse do?

The solution is  $\frac{100}{5} = 20$  stages and  $10 \times 5 = 50$

Proof.  $5 \times 100 = 500$  . . . . .

Mahāvira gives a similar example (vi, 158).

*ravi-ratha-turagās sapta hi chatvāro'svā rahanti dhūryuktāḥ |*

*yojana-saptati-gatyaḥ ko vyūḍhaḥ ko chaturyogaḥ ||*

'It is well known that the horses of the Sun's chariot are seven. Four horses are yoked at a time. They have to perform a journey of 70 *yojanas*. How many times are they unyoked and how many times yoked.'

Mahāvira's solution is expressed thus:

The number of the total *yojanas* divided by the total number of horses gives the *yojanas* in turn. These *yojanas* multiplied by the optionally chosen number of horses to be yoked gives the measure of the distance to be travelled over by each horse.

That is  $\frac{70}{4} = 17\frac{1}{2}$  is the length of each stage; and  $10 \times 4 = 40$  gives the distance each horse works.

The solution is rather cryptic, but the interesting point is that the problem was a traditional one. Probably something of its original quality has been lost.

## B 1—contd.

B 2. [9 recto.] See the notes on fol. 7 verso. The writing is of the same style, α4. Possibly there are two leaves stuck together.

The example is a=1, d=1, A=10, and  $10t=((t-1)\frac{1}{2}+1)t$  whence  $t=\frac{2.10-2.1}{1}+1=19$  and by the rūpoṇa method s=190.

Dr. Hoernle gave the following restoration:

"For a certain feast one Brāhman is invited on the first day, and on every succeeding day one more Brāhman is invited. For another feast 10 Brāhmans are invited on every day. In how many days will their numbers be equal; and how many Brāhmans were invited."

The use of the term labdham is here rather curious. The phrases labdham dviguṇitam kritvā, tathādvayūnam, uttareṇa vibhājitam and rūpādhikam are probably quotations from a sūtra.

B 2. [9 verso.] The example probably meant: 'A and B start for a place 70 yojanas distant. A travelled at the rate of 1 yojana a day and B at the rate of 6. At what point on his return journey did B meet A?'

Since  $\frac{x}{1}=\frac{2.70-x}{6}$ , where x is the distance traversed by A, we have  $x=\frac{2.70}{6+1}=20$  as given in the text, and since A travels at the rate of one yojana a day, this is also the time.

Proof by the 'rule of three' 1 day : 6 yo° :: 20 days : 120 yo°, and 70-20=50 and 70+50=120. Also 1 day : 170° :: 20 days : 20 yo°.

The abbreviation sa° may be for sanairga 'slow goer.'

B 3.

[7 verso.] Folio 7 is a very interesting sheet. The writing may be classed as α4. On examining the original I noted that it was a double sheet, but the reproduction (Plate vi) might lead one to conclude that it was a palimpsest. Probably, however, the writing underneath is showing through, or the faint writing marks have been impressed from the contiguous leaf. The two sides are definitely disconnected by their contents and the right side has now been definitely located between folios 6 and 65. Folios 7 (verso), 8 and 9 are difficult to place. Indeed there seems to be some duplication. Folio 5 certainly follows folio 4 and section C cannot very well include folios 7 (verso), 8 and 9.

i. The problem is  $7t = ((t-1)\frac{1}{2} + 3)t$  whence  $t = \frac{2(7-3)}{4} + 1 = 3$ . By the rūpoṇa method  $s = [(3-1)\frac{1}{2} + 3]t = 21$  and by the 'rule-of-three'  $1 : 7 :: 3 : 21$ .

The phrases ādim viśoddhya, uttarārdhena bhājitaṁ and labdham sa rūpa are quotations from a lost sūtra. Compare with fol. 8 recto.]

ii. udā° || aṣṭā-daśa yojanā ekena dine yātī |

tasyāṣṭa dinā gatasya |

dvitīya pañcha-vimśe yojanā dine yātī |

B 4. [4 recto.] The writing changes, due possibly to the use of a different pen, but it is different and may be termed α3. This leaf is closely connected with fol. 3 recto and with fol. 5.

i. The example may be restored : One goes at the rate of 5 yojanas for 7 days and then a second starts at the rate of 9 yojanas a day. When will they have traversed equal distances ?

The phrase *gatisyaiva viśesham cha* is a quotation from *sūtra 15* (fol. 3 recto) and *pūrva gata* is a reference to the same rule.

The solution is  $t = \frac{7 \cdot 5}{9 - 5} = \frac{35}{4}$  days. 'Proof by the rule of three'  $1 : 5 :: \frac{35}{4} : \frac{175}{4}$  and  $1 : 9 :: \frac{35}{4} : \frac{315}{4}$  <and  $\frac{315}{4} - \frac{175}{4} = 35$ >.

One travels at the rate of 18 yojanas in one day for a period of 8 days. A second goes at the rate of 25 yojanas in one day. Determine in what time.

The eleventh leaf must have been close by : indeed *pūrvapi* seems to indicate that it was 'just before.'

karaṇam | ‡ ādyor viśesha‡ . . . . .

B 4. iii. The rule means (?)  $t=2 \frac{(a_1-a_2)}{d_1-d_2} + 1$ . Note that the next *sūtra*, on the reverse, commences with the same phrase *ādyor viśesha*.

[4 verso.] i. The example was  $a_1=4$ ,  $d_1=3$ ;  $a_2=6$ ,  $d_2=1$ . Where  $a_1$  and  $a_2$  are the first terms and  $d_1$  and  $d_2$  are the increments of arithmetical progressions, the sums of which were equal. Therefore  $(t-1)\frac{3}{2}+4=(t-1)\frac{1}{2}+6$  whence  $t=2 \frac{(6-4)}{3-1}+1=3$ .

The proof is by the *rūpona* method, namely,  $s_1=((3-1)\frac{3}{2}+4)3=21$  and  $s_2=((3-1)\frac{1}{2}+6)3=21$ . But 'why should it be written out in full?' See Part I, § 73.

The remark that the *sūtra* is wrongly numbered was probably added later by some one other than the original scribe. The next *sūtra* is numbered 18 (fol. 5) and so on. This is not a copyist's error: it is one of an original MS.

ii. The rule is much the same as the previous one and means that  $t=2 \frac{(a_1-a_2)}{d_1-d_2} + 1$  when  $((t-1)\frac{d_1}{2}+a_1)t=((t-1)\frac{d_2}{2}+a_2)t$ . The rule is quoted below and on fol. 5 recto.

iii. The example gives  $a_1=2$ ,  $d_1=3$ ;  $a_2=3$ ,  $d_2=2$  < whence  $t=3$  and  $s=15$  >.

C 1.

[5 recto.] The writing is the same as that on folio 4, namely α3, but it changes again in the middle of 5 recto.

i. The example is  $a_1=5$ ,  $d_1=6$ ;  $a_2=10$ ,  $d_2=3$ , where  $((t-1)\frac{a}{2}+5)t=((t-1)\frac{a}{2}+10)t$ ; and the solution is  $t=2(a_2-a_1)/(d_1-d_2)+1$  or  $2(10-5)/(6-3)+1=17$ .Proof by the rūpoṇa method  $s_1=<((\frac{1}{2}-1)\frac{a}{2}+5)\frac{1}{2}=((\frac{1}{2}-1)\frac{a}{2}+10)\frac{1}{2}>=65$ .

The sūtra number should probably be 17. See fol. 4 verso.

ii. The writing now changes to what may be termed the α4 style. The rule means that < if  $DT+Dt=((t-1)\frac{d}{2}+a)t$  > then

$$t = \frac{\sqrt{(d-2(a-D))^2 + 8dDT} + d - 2(a-D)}{2d}$$

where  $D$  and  $T$  are fixed quantities and  $a$ ,  $d$  and  $t$  are elements of an arithmetical progression of which  $a$  and  $d$  only are given.The quantity designated pratinihita 'set aside' is  $d-2(a-D)$ , while the kshepa samjñako rāśi 'the quantity known as kshepa' is  $\{d-2(a-D)\}^2$ .[5 verso.] Writing α4. Notice a semi-looped medial  $o$  near the end.i. The example is <  $D=5$ ,  $T=6$ ,  $a=3$ ,  $d=4$ ; hence  $t=\frac{\sqrt{(2(5-3)+4)^2+8.4.5.6}+2(5-3)+4}{2.4}$  >. The solution proceeds step by step thus:  $DT=5.6=30$ ,  $D-a=5-3=2$ ,  $2(D-a)=4$ ,  $2(D-a)+d=4+4=8$ ;  $(2(D-a)+d)^2=64$  and 'this is known as the kshepa quantity';  $SDT=240$ ,  $SDTd=960$ ;  $SDTd+(2(D-a)+d)^2=1024$ ;  $\sqrt{1024}=32$ ;  $2(D-a)+d+32=40$ ; and <  $\frac{40}{8}=5$  >.

Almost the whole of the sūtra on 5 recto is quoted here and on the following pages.

C 2. [6 recto.] i. Continues the example. 'Proof by the rule of three' 1 : D :: t : Dt or 1 : 5 :: 5 : 25 and DT+Dt=30+25=55.

ii. The next example is D=7, T=5, a=5, d=3; hence  $t = \frac{\sqrt{(2)7-5)+3)^2+8.3.7.5+2(7-5)+3}}{2.3}$

Part of the solution is lost < DT=35, 2(D-a)+d=7, 7<sup>2</sup>=49 >. It is continued on 6 verso.

[6 verso.] i. Continues the solution: 8DTd=840; 8DTd+(2(D-a)d)<sup>2</sup>=889. Here the solution breaks off in order to tackle the problem of obtaining the root of a surd quantity, and a subsidiary (un-numbered) *sūtra* is given.

ii. The rule recurs on folios 56 recto and on 57 verso, and with the help of these other versions it has been restored as above.

The rule means that an approximate root of  $\sqrt{A^2+b}$  is  $A + \frac{b}{2A}$  and that the difference between the squares of these two quantities is  $(\frac{b}{2A})^2$ ; and that by continuing the process closer approximations can be obtained. For a discussion of this rule see Part I, §§ 68, 69, 85. The three versions as they now stand are—

akṛite śli . . . . . chchhedo dvi-saṃguṇaḥ 6 Verso.  
tad vargaḥ dala | saṃslishṭha | hṛit . . . . . yah

. . . . . kṛityūnā śeśha chchhedo dvi-saṃguṇaḥ | 56 Recto.

tad varga . . . . . ślishṭhaḥ hṛiti śuddhi kṛiti kshayaḥ ||

akṛite ślishṭha kṛityūnā śeśha chchhedo dvi . . . . . 57 Verso.

. . . . . varga dala saṃslishṭha hṛiti śuddhi kṛiti kshayaḥ . . . . .

iii. The solution is resumed: < since 889=841+48=29<sup>2</sup>+48 > the first approximation to  $\sqrt{889}$  is 29 $\frac{4}{5}$  and (terming this q<sub>1</sub>) we have q<sub>1</sub>+2(D-a)+d=29 $\frac{4}{5}$ +7=36 $\frac{4}{5}$ = $\frac{188}{5}$  < and t<sub>1</sub>= $\frac{2136}{58 \times 6} = \frac{178}{23}$  > where t<sub>1</sub> is an approximate value depending on q<sub>1</sub>.

ekona-vimśatima sūtram 19 ||

C 3. [7 recto.] This continues the example started on fol. 6 recto. [The numbers marked with asterisks are change-ratios (see Part I, §§ 103—105).] The set of figures on the left expresses  $\frac{178}{29}$  as a sexagesimal fraction (see Part I, § 58), i.e.,  $\frac{178}{29} = 6 + 8' + 16'' + 33''' + 6''''$ . The portion of the statement above the 16 is missing but the restoration is certain. Of the abbreviations *cha°* has not yet been identified; *li°* stands for *liptā* (Gk. λειπτα); *vi°* for *viliptā*; *śe°* for *śesham* 'remainder.' In Hindu astronomical works *liptā* means a 'minute of arc,' and *viliptā* 'a second of arc.' This use of the sexagesimal notation for arithmetical purposes in an Indian work is unique. The solution proceeds to find the approximate value of  $s_1$  which depends on  $t_1$  and ultimately  $q_1$ . We have  $s_1 = ((t_1 - 1) \frac{d}{2} + a)t_1$ . Now  $(t_1 - 1)d = (\frac{178}{29} - 1)3 = \frac{447}{29}$ ;  $(t_1 - 1) \frac{d}{2} = \frac{447}{58}$ ;  $(t_1 - 1) \frac{d}{2} + a = \frac{447}{58} + 5 = \frac{737}{58}$ ; and  $((t_1 - 1) \frac{d}{2} + a)t_1 = \frac{737}{58}$ .  $\frac{178}{29} = \frac{65593}{841}$ .

But  $DT + Dt_1 = 7(5 + \frac{178}{29}) = \frac{65593}{841} = 77\frac{512}{841}$ .

'Proof by the rule of three':  $1 : 7yo° :: \frac{178}{29} : 42\frac{28}{29}$  and  $< 48\frac{28}{29} + 35 = 77\frac{512}{841} >$ .

[Note that  $\frac{65593}{841} - \frac{65593}{841} = \frac{24}{841} = (\frac{48}{29})^2 \times \frac{1}{63} = \frac{61}{63}$ . This process of reconciliation is explained in Part I, § 55.]

The *sūtra* number should probably be 18. See fol. 4 verso.

C 4. [65 verso.] Folio 65 consists of two leaves stuck together. The writing on both sides may be classed as α4. The left side has no direct connexion with fol. 7 recto but it belongs to the same section.

The *sūtra* here quoted from is lost, or hidden, for possibly when folios 7 and 65 are separated it may be discovered. It may be said to be one of the most important *sūtras* of the whole work judging by the care and elaboration with which it is illustrated. It must mean that < when  $s = ((t - 1) \frac{d}{2} + a)t$  then  $t = \frac{\sqrt{(2a - d)^2 + 8d} - (2a - d)}{2d}$  > where  $a$ ,  $d$ ,  $t$  and  $s$  are respectively the first term, the common difference, the number of terms and the sum of an arithmetical progression.

The example is  $a = 1$ ,  $d = 1$ ,  $s = 60$ ; hence  $t = \frac{\sqrt{(2 - 1)^2 + 8 \cdot 1 \cdot 60} - (2 - 1)}{2 \cdot 1} = \frac{\sqrt{481} - 1}{2}$ .

The solution proceeds  $8ds = 480$ ,  $2a - d = 1$ ,  $(2a - d)^2 + 8ds = 481$ ; by the square-root method (see fol. 6 verso) the first approximation is  $21\frac{40}{42} = \frac{882 + 40}{42} = \frac{922}{42}$  and  $< t_1 = (\frac{922}{42} - 1) \div 2 = \frac{880}{54} >$ .

## C 5.

425042	400	śesham	424642
19362	19362		19362

O 6. [56 verso.] Continues the example.  $s_1 = ((t_1 - 1)^{\frac{1}{2}} + 1) t_1 = t_1 \frac{(t_1 + 1)}{2} = \frac{848}{91} \cdot \frac{964}{168} = \frac{816720}{14112}$ , but  $< \frac{c_1}{8d} = (\frac{40}{2,21})^2 / 8 > = \frac{1600}{14112}$  and  $\frac{848320 - 1600}{14112} = \frac{816720}{14112} = 60$ .

The bottom half of fol. 56 verso is blank but the example is continued on 56 recto.

[56 recto.] This continues the example given on fol. 65 verso. The top part of the leaf is much broken up; but the square-root rule (see fol. 6 verso) is given. Why this rule is repeated is not quite understood nor is it understood why it comes between two approximations of the same surd. Anyhow the general aim is clear: since the first approximation is  $21\frac{2}{1}$  the second is given by

$$q_2 = 21\frac{2}{1} - \frac{1}{2} \cdot (\frac{2}{1})^2 / 21\frac{2}{1} = 21\frac{2}{1} - \frac{1}{441} \times \frac{21}{401} = \frac{421,612}{19362}$$

## C 6.

405280	444004	ardham kartavyam	64 recto.
38724	38724		

405280	444004	saṃguṇya jātam	a . . . . hrarā hareshu guṇ

- C 8. [45 recto.] i. The greater portion of this example is lost, but can be restored. The example was  $a=1\frac{1}{2}$ ,  $d=1\frac{1}{2}$ ,  $s=2$ ; whence  $t = \frac{\sqrt{10}-3}{6}$ . The first approximation to  $\sqrt{10}$  is  $q_1=10\frac{1}{4}$  and the second is  $q_2=10\frac{1}{4}-\frac{1}{2}(\frac{1}{4})^2/10\frac{1}{4}=10\frac{81}{328}$ . This gives  $t_2=\frac{10\frac{81}{328}-3}{6}=\frac{59425}{49200}$  and  $e_2=(\frac{59425}{49200}-1)\frac{1}{2}+\frac{1}{3}=\frac{10225}{32800}\cdot\frac{1}{2}+\frac{1}{3}=\frac{59425}{65600}+\frac{1}{3}=\frac{108625}{65600}$ .  $\frac{59425}{49200}=\frac{6,455,040,625}{3,227,520,000}$ . < Now  $\frac{e_2}{8d}=\frac{625}{3,227,520,000}$  (see Part I § 86 (v)) > and  $s=s_2-\frac{e_1}{8d}=\frac{6,455,040,625-625}{3,227,520,000}=2$ .
- ii. The statement without any formal question should be noted. The example is  $a=1\frac{1}{2}$ ,  $d=1\frac{1}{2}$ ,  $s=7000$ . The first part of the solution is lost but a good deal of the later working is preserved on folios 45 verso and 46 recto. We have  $q_1=579\frac{768}{1168}$ . (See part I, § 86 (vi).)
- 45 verso. The second approximation is given by  $q_2=579\frac{768}{1168}-\frac{1}{2}(\frac{384}{579})^2/579\frac{768}{1168}=579\frac{768}{1168}-\frac{(384)^2}{671250}=579\frac{768}{1168}-\frac{294,912}{777,807,500}=579\frac{515,520,000-294,912}{777,807,500}=579\frac{515,225,088}{777,807,500}=\frac{450,576,267,583}{777,807,500}$ . Continued on folio 46 recto.

D 2. \* [70]. Folio 70 consists of 5 scraps not obviously connected. The writing may be classed as α<sub>2</sub>. The 'find order' is 65 and this and the five following fragmentary leaves are placed in their 'find order,' for want of some more reliable basis of classification.

70 recto is mostly unintelligible but  $x(\frac{1}{2} + \frac{1}{3} + \frac{1}{4}) = 13$  and  $x=12$  is a solution.

70 verso. Here  $x(\frac{1}{2} + \frac{1}{3} + \frac{1}{4}) = 65$  and  $x=60$  is obviously connected in some way with the example on 70<sup>c</sup> recto but they are two separate examples.

D 3. Folio 69 consists of four pieces but is not quite so shabby as folio 70, for the two larger pieces fit together.

[69 recto]. The statement means  $x(\frac{1}{2} + \frac{1}{3} + \frac{1}{4}) = 214$  whence  $x = 210$ . The 'proof by the rule of three' is

5 ā° : 2 tam° :: 210 : 84 tam° < and  $84 + 70 + 60 = 214$  >

6 ā° : 2 tam° :: 210 : 70 tam°

7 ā° : 2 tam° :: 210 : 60 tam°

[69 verso]. Here  $x(1 + 3 + 9) = 130$  whence  $x = 10$  and the numbers are  $10 + 30 + 90 = 130$ . Again  $x(4 + 6 + 9) = 190$  and  $40 + 60 + 90 = 190$ .

## D 4.

168	deśa dvātya	pātya jātā	68 recto,
4			

śeṣam\* 21 . . . . . ekatram 29 . . . . . dram 2 . . . . .

. . . . . bāri . . . . .

D 4. [68 recto.] Consists of small fragments which probably belong to folio 67. Writing  $\alpha_2$ . The phrase *pātya śeṣam* occurs on some six other occasions (on folios 31, 62, 63, 56).

## D 5.

1	traī-rāśikena	2 dine 1	3 dram° 1 2	168 di 11	31 recto.

	1+	4			
dvitīyasya	bhā 3 dine	dram°			
	1				
	3				

D 5. Folio 31 consists of two leaves stuck together and the writing on the two sides differs. The leaf is very ragged.

[31 recto.] The writing may be classed as  $\alpha_2$ .

i. The example may be restored with some uncertainty: A earns  $3\frac{1}{2}$  *drammas* in 2 days, B<sup>r</sup> earns  $2\frac{1}{2}$  in 3 days, A gives B 7 *drammas* and this makes their possessions equal. How long had they been earning?

< Since  $\frac{3\frac{1}{2}}{2}t - 7 = \frac{2\frac{1}{2}}{3}t + 7$  we have  $t = \frac{14}{7/4 - 5/6} = \frac{14}{1/12} = 168$  days. >

Proof by the rule of three 2 days :  $3\frac{1}{2}$  *drammas* : :  $\frac{14}{11}$  days :  $\frac{294}{11}$  *drammas*

and 3 days :  $2\frac{1}{2}$  *drammas* : :  $\frac{14}{11}$  days :  $\frac{140}{11}$  *drammas* !

and  $\frac{294}{11} - \frac{140}{11} = \frac{154}{11} = 14$  days.

ii. Another example of the same kind.

## D 5—contd.

1	1	1	

E 1. Folio 66 consists of a bad piece of birch-bark containing a large knot. The knot is repeated on folio 53. The find order is 58. Writing is probably α4.

The problem may have been something like this: The rates of purchase are one, two, three, four and six articles for one dramma. What will be the cost of twelve of each?

The cost of one of each would be  $1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{6} = \frac{7}{2}$  therefore the cost of 12 of each is 27 drammās, and the numbers of articles are 12, 6, 4, 3 and 2.

'Proof by the rule of three'

1 dram°	1 rū°	12 dram°	12 rū.
1 "	2 "	6 "	12 "
1 "	3 "	4 "	12 "
1 "	4 "	3 "	12 "
1 "	6 "	2 "	12 "

## E 2.

1 yo°	1 di°	6 . . . . .
1	1	1
2		

53 recto.

viśeṣaṁ tu tatra gatim      3 2      viśeṣaṁ      1      . . .      sarva gati  
                                  2 1                                   2

E 2. Folio 53 resembles fol. 66 in appearance and has the same large knot. Its find order is not known. Writing? α4. The problems are, however, similar to that on fol. 9 recto.

[53 recto.] The following conjectural restoration of the problem is offered:

One goes  $1\frac{1}{2}$  yojana in a day and another 6 in 3 days. If the first had a start of 9 yojanas when would the second overtake him?

Since  $\frac{3}{2}t + 9 = 6t$  we have  $t = \frac{9}{\frac{3}{2}} = 18$  days.

'Proof by the rule of three': 1 day :  $\frac{3}{2}$  yo° : 18 days : 27 yo° and 27 + 9 = 36  
 1 " : 2 yo° : 18 " : 36 yo°

## E 2—contd.

yojana | 9 | anena guṇaye | 18 | anena . . . . bhavishyati .

pratyaya trai-rāśikena | 1 di° | | yo° 27 dina 6 ādau yojana 9 .

| . | 1 | 1 di° | . . yo° | phalaṁ yojana

. . . .	18 yojana	20 dina	phalaṁ yo° 27	53 verso	53 verso
	1	20 ghaṭike	7		
		35* gha° dina			
. . . .	27 yo	20	pha° yo 36		
		20 ghaṭike	7		
		35* ghaṭike dina			

[53 verso.] The following is merely a guess at the problem: One goes 18 yojanas in 96 days and another 27 yojanas in 108 days. The first starts from A and the second from B and the distance AB is 9 yojanas. When will they meet if they go only for  $\frac{1}{2}$  or 35 ghaṭikas of each day? (60 ghaṭikas=24 hours).

In one day they together go  $\frac{18}{96} + \frac{27}{108} = \frac{7}{12}$ , that is they meet at the rate of 1 yojana in  $\frac{12}{7}$  days and actually meet each other in  $\frac{9 \times 16}{7}$  days = 20 $\frac{4}{7}$  or 20 days 20 ghaṭikas.

Proof 96 days : 18 yo° :: 20d. 20 gha° :  $\frac{27}{7}$  yo° and  $\frac{27}{7} + \frac{18}{96} = 9$ .

108 days : 27 yo° :: 20d. 20 gha° :  $\frac{27}{7}$  yo.

## E 3.

udā° || śaḍ-vimśas cha tṛi-pañchāśa ekona-tṛimśe vacha |

58 recto

dvā-śa . . śaḍ-vimśa chatuś-chatvālimśa saptati |

trir-āśīti ekavimśa aṣṭa . . . . pakam |

. . . 296226447064994 . . . .

E 3. [Folio 58.] Find order not known. Writing ? α4. Possibly two leaves stuck together.

[58 recto.] This gives pairs of numbers, first in words and then in figures, thus :

Twenty-six and fifty-three and one less thirty

. . . . . twenty-six, forty-four, seventy

sixty-four . . . . .

eighty-three, twenty-one, . . . . . eight . . . .

and in figures . . . . . 29 62 26 44 70 64 99 4 . . . .

## E 3—contd.

58 verso

sthāpanam kriyate . . .	1 1	yuvi 1 1	sūḍha 1 1	ḍṛishya 20
. . . 3		maṁ 1 1 2	maṁḍa 1 2	maṁḍe 20

ta datta jātam maṁḍa 2    yu 5    sūḍhe 1 . . . .

[58 verso.] There is basis for the following restoration—

A man earns 3 in one day, a young woman  $1\frac{1}{2}$  in 1 day and . . . .  $\frac{1}{2}$  in one day. If 20 earn 20 maṁḍas in one day, how many of each will there be?

Let x, y, z be the numbers of each class, then  $x+y+z = 20$  individuals

$$3x + \frac{3}{2}y + \frac{1}{2}z = 20 \text{ maṁḍas}$$

of which the only solution in positive integers is that given in the text, namely  $x=2$ ,  $y=5$ ,  $z=13$ . This problem known as the 'Hundred Hens' problem in China, and as the *Regula Virginum*, etc., in Europe is noted upon in Part I, §80 (a).

## E 4.

1 di° 3	1 di° 2	5 di 1	

karaṇam || . . . . . kṛitvā

3 1	2 1	3 5	dri° 100 1
--------	--------	--------	---------------

4. Folio 21 consists of 7 scraps of which the largest piece is partly intelligible. The find order is 55 and the writing α1, 4.

[21 recto.] Apparently this means: 1 rū° is given or obtained in  $\frac{1}{3}$  days, 1 in  $\frac{1}{2}$  day and 3 in 5 days by three separate individuals (or classes) and the total amount given or obtained is 100.

In one day  $\frac{1}{3} + \frac{1}{2} + \frac{3}{5} = 3 + 2 + \frac{3}{5} = 5\frac{3}{5}$  is given, so that one is given in  $\frac{5}{8}$  days and 100 in  $\frac{500}{8} = 17\frac{5}{8}$  days.

## E 4—contd.

. . . . . vārdham tritīyasya 21 verso  
jīva-lokāt eshām dīnār . . . . . kasya kim bhavati ||

2 dī°	3 dī°	4 dī°

1 dī°	1 dī°	1 dī°
1	1	1
2	3	4

. . . . . parivartanam kriyate	10 6	21 8	36 10	dī 500 1
--------------------------------	---------	---------	----------	-------------

prakshe . . . . .

[21 verso.] Here the main elements of a problem are preserved and the problem is continued on folio 22. The problem probably was to the effect that: A gave  $2\frac{1}{2}$  dīnāras in  $1\frac{1}{2}$  days, B gave  $3\frac{1}{2}$  in  $1\frac{1}{2}$  days and C  $4\frac{1}{2}$  in  $1\frac{1}{2}$  days. In what time would they have given 500 dīnāras?

In one day  $\frac{2\frac{1}{2}}{1\frac{1}{2}} + \frac{3\frac{1}{2}}{1\frac{1}{2}} + \frac{4\frac{1}{2}}{1\frac{1}{2}} = \frac{10}{6} + \frac{21}{8} + \frac{36}{10} = \frac{947}{120}$  is given. Therefore 500 is given in  $\frac{500 \times 120}{947} = \frac{60000}{947} = 63\frac{230}{947}$  days>

Continued on fol. 22 recto.

## E 5.

1	1	1	

- ii. sūtraṁ || yadrichchha pinyase sūnye tadā vargaṁ tu kārayet

- F 1. [22 verso.] i. This appears to be the beginning of a new section. The sūtra is lost. Find order 54, writing α4.  
 The problem was something like this: A certain amount was given to the first, twice that to the second, thrice it to the third, and four times to the fourth. State the amount given to the first and the shares of the others, if the total amount given was 200.  
 The shares are represented by 0, 2, 3, 4. 'Having added one to the nought' the sum is  $1+2+3+4=10$ . <Then the proper share of the first is  $\frac{200}{10}=20$ > . Having added in this value the series becomes  $20+40+60+80=200$ .  
 The proof by the rūpoṇa method gives  $<((4-1)\frac{2}{3}+20)4>=200$ .  
 For the method of solution, the *regula falsi*, see Part I, §§71 and 72, and for the rūpoṇa method see §73. The whole section is dealt with in §87, and the use of the symbol for 'nought' in §60.  
 ii. The sūtra begins "Put what number you please in the empty place (or for the nought)." This is quoted on fol. 23 recto and so is tadā vargaṁ tu kārayet, etc.

## F 2.

- i. . . . . cha tri-guṇaṁ . . . . . 23 recto.

. . prakshiptaṁ 33 ||| drishyaṁ vibhajet | 132 | vartyaṁ jātaṁ | 4 |  
 33 1

- F 2. [23 recto.] The find order is 52.  
 i. The example may be represented by  $x+2T_1+3T_2+4T_3=132$ : Where  $T_1, T_2$ , etc., represent the values of the first, second, etc. terms. Make  $x=1$  then the terms are  $1+2+6+24=33$  and the proper value of  $x$  is  $\frac{132}{33}=4$  and the series becomes  $4+8+24+96=132$ .  
 All the technical terms here employed are of interest and will be dealt with in due course: *ichchhā* 'an assumed number'; *varga* 'a series'; *prakshepa* 'something thrown in' or 'an interpolation'; *vartya* 'cancelled'; *drishya* 'the given number'; etc.

## F 2—contd.

. . . . . dattam || ato nyāsaḥ | 4 | 8 | 24 | 96 | . . . . .

varga gaṇitam ||

ii. udā° || prathamasya na . . . . . dattam chaivā dhānam |

sa cha dvyārdha yuta dhānam . . . . .

ii. The term *kāmika* is practically synonymous with *icchā* or *yadricchā* 'what you please'; 'an assumed number.' Bhāskara uses *ishṭa* much in the same way. A good deal of the *sūtra* is quoted on fol. 23 verso.

[23 verso.] i. The example may be represented by  $x+2T_1+3(T_1+T_2)+4(T_1+T_2+T_3)=300$ . Put  $x=1$  then the series becomes  $1+2+9+48=60$  and the proper value of  $x$  is  $\frac{300}{60}=5$  and we have  $T_1=5$ ,  $T_2=10$ ,  $T_3=45$ ,  $T_4=240$  and  $\Sigma T=300$ .

ii. The example is solved on fol. 24 recto.

## F 3.

śataṁ chatuś-chatvalimsā . . . . . \*\*dattam chaiva chaturguṇam\*\*

24 recto

kiṁ prathamasya . . . . .

0	1	2	2	3	3	4	4	dri°	144
1	1	1	1	1	1	1	1		1
	2		2		2		2		2

F 3. [24 recto.] The example may be represented by

$$[x(1+T_1)]+[2T_1+2T_2x]+[3T_2+3T_3x]+[4T_3+4T_4x]=144\frac{1}{2}$$

Set  $x=1$  and the series becomes  $\frac{5}{2} + \frac{10}{2} + \frac{45}{2} + \frac{240}{2} = \frac{300}{2} = 144\frac{1}{2}$  which is the same as the given sum and therefore  $x=1$  is correct.

The phrase marked \*\* is deleted in the original. The expression "*upare uparam adhe adham guṇaye*" is obviously quoted from a well known rule relating to fractions: 'numerator should be multiplied by numerator and denominator by denominator.' See also C5, D5.

sajāti kṛiyā

G 1. Folios 10 to 15 form a fairly well defined section and the leaves are among the best preserved of the manuscript. The 'find order' is 42, 41, 40, 39, 7, 29 and the writing α2. The sūtra numbers 24 and 25 occur.

[10 recto.] i. The end of the sūtra is marked with the usual design and the sūtra is numbered 24; so that from 10 recto to the end of 15 recto consists of one sūtra (25) and its illustrative examples.

ii. Of sūtra 25 the only complete word preserved is *vinirdeset*. It is reconstructed from quotations and fragments of letters. The sūtra is the most quoted one in what remains of the original text, the phrase *kṛtvā rūpa kshayaṁ pārtha* occurring some seven times. The last word of this phrase is, however, variously written *pārtha* (fol. 10 recto), *pāstham* (10 verso), *pāstam* (12 recto et verso), *pāstha* (14 verso) and is rather curiously omitted on fol. 11 recto. This variation is very curious, because the ligatures *rtha*, *stha*, *sta* are so very unlike that the differentiation can hardly be one of carelessness in writing (and the writing is here particularly good). The meaning of the term is still obscure. Dr. Hoernle suggested *prāsta* 'thrown out' or 'wastage'; but I would translate the whole phrase by 'Having calculated for unity the loss per term.' The following is Dr. Hoernle's translation of the sūtra—

'Calculate the loss in one; let the instalments of wastage be multiplied together; with the result let the original provision be multiplied; take the result to be the required remainder.'

iii. The example may be rendered:

'The third part of the burnt bronze in three instalments (is lost). The amount given was one-hundred and eight. State the remainder, O Pandit.'

The solution according to the rule gives  $108 (1-\frac{1}{3}) (1-\frac{1}{3}) (1-\frac{1}{3}) = 32$ . But proceeding by steps  $108 \cdot \frac{2}{3} = 72$  and the remainder is 36;  $72 \cdot \frac{2}{3} = 48$  and the remainder is 24;  $48 \cdot \frac{2}{3} = 32$  and the remainder is 16.

The proof may be represented by  $x^3 = \frac{32}{(1-\frac{1}{3}) (1-\frac{1}{3}) (1-\frac{1}{3})}$   
 Continued on the reverse;

## G 1—contd.

i.	0	tribhi tryashṭa-bhāga saṃyutam	10 verso.

		7   1   98   phalam 140	
		10   1   1	

G 1. [10 verso.] i. Gives further proofs of the example on the obverse, namely:

$$x^1 (1 - \frac{1}{3}) (1 - \frac{1}{3}) (1 - \frac{1}{3}) = <32, \text{ hence } x=108>;$$

then two proportions in words and figures  $\frac{2}{3} : 1 :: 108 : 32$  and  $1 : 3\frac{2}{3} :: 32 : 108$ .

ii. Example.—Of iron once refined three-tenths is lost. What is the remainder of twice seventy, tell me Pandit ?

The loss on unity is  $\frac{3}{10}$  and the remainder is  $\frac{7}{10}$ . The original quantity is 140 and  $\frac{7}{10}$  of 140=98. The loss is therefore 42 and 98+42=140.

Proof.  $\frac{7}{10} : 1 :: 98 : 140$

Continued on fol. 11 recto.

## G 2.

		3+	
		10	
ii.	udā°	. . palā kṛite pala tri-bhāgam kshya vrajati	
		ashṭa-daśa . . . . . thatām brūhi	

G 2. [11 recto.] i. Continued from fol. 10 verso. 'Proof  $x(1 - \frac{3}{10}) = <98, \text{ therefore } x=140>$

ii. Example.—In purchasing one and a half *palas* the loss is one-third. State what would be the loss on eighteen.

Since  $\frac{1}{3} : \frac{3}{2} = \frac{2}{3}$ , the loss on unity, the remainder is  $\frac{2}{3}$ . Now  $\frac{2}{3}$  of 18 =14 and the loss is 4.

Proof by the rule of three :—  $1\frac{1}{2} : \frac{2}{3} :: 18 : 4$  and  $\frac{1}{3} : 1\frac{1}{2} :: 4 : 18$ .

tad iti

śesha 158 to° 1 še° 1  
64

iii. Example.—In refining bronze there is a loss of one-fourth. What would be the loss on 500 suvarṇas four times refined ?

The solution is lost. It amounted to  $< 500 (1-\frac{1}{4}) (1-\frac{1}{4}) (1-\frac{1}{4}) (1-\frac{1}{4}) = 158\frac{1}{8} = 158 \text{ suvarṇas} + 1\frac{1}{8} \text{ tolās}$ , since  $5 \text{ tolās} = 1 \text{ suvarṇa}$ .

Continued on the reverse.

G 2. [11 verso.] This appears to have contained five proofs of the example on the obverse, for the present third proof is designated 'the fourth.' The proofs are—

i. Missing.

ii.  $x^4(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4}) = 158 \text{ su}^\circ + 1\frac{1}{8} \text{ to}^\circ$  therefore  $x^4 = 500$ .iii.  $500 (1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4}) = x^4$  and  $x = 158 \text{ su}^\circ + 1\frac{1}{8} \text{ to}^\circ$ .iv.  $x^4 = (158^\circ \text{ su}^\circ + 1\frac{1}{8} \text{ to}^\circ) \div (1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})$  and  $x^4 = 500$ .v. The first loss is  $\frac{1}{4} \times 500 = 125$  and the remainder is 375.The second loss is  $\frac{1}{4} \times 375 = 93\frac{3}{4} = 93 \text{ su}^\circ + 3 \text{ to}^\circ + 9 \text{ māsha}$ . (Since  $12 \text{ mā}^\circ = 1 \text{ to}^\circ$ ) and the remainder is  $281\frac{1}{4}$ .The third loss is  $281\frac{1}{4} \div 4 = 70\frac{3}{8}$  add the remainder is  $210\frac{1}{8}$ .The fourth loss is  $210\frac{1}{8} \div 4 = 52\frac{3}{8}$  and the remainder is  $158\frac{1}{8}$ .

G 3. [12 recto.] This is not directly connected with folio 11 but is probably correctly placed here. The find order places it between folios 11 and 13 and it is definitely connected with folio 13. Also it quotes from *sūtra* 25 on folio 10 recto. It has the same knot as folio 13.

The example may be conjecturally restored : A traveller goes a journey of 4 *gavyūti*s and takes with him 4 *prasthas* of wine. After each *gavyūti* he drinks 1 *prastha* and then fills up his bottle with water. How much wine and how much water will there be at the end of his journey ?

The preliminary part of the solution is rather confused. Possibly the *visarga* marks denote deletion. The general solution is  $4 \cdot \frac{3}{4} \cdot \frac{3}{4} \cdot \frac{3}{4} = 4 \cdot \frac{27}{64} = 1 \frac{13}{16}$  *prasthas* of wine remain and  $2 \frac{3}{4}$  *prasthas* of water. The number of *gavyūti*s in a *yojana* are mentioned (12), and the number of *prasthas* in an *ādhaka* are said to be 4 and the number of *kūḍavas* in an *ādhaka* are given as 16. Therefore the wine left over  $\frac{3}{4} = 1$  *prastha* +  $1 \frac{1}{16}$  *kūḍavas* and the water  $= 2 \frac{3}{4} = 2$  *prasthas* +  $2 \frac{1}{16}$  *kūḍavas* and the sum of these is 4 *prasthas*.

Continued on the reverse.

. . . . .

G 3. [12 verso.] i. The solution of the example on the obverse is now done by steps. The original amount of 4 prasthas is expressed in kuḍavas, namely 16.

Of these 16 kuḍavas of wine he drinks  $\frac{1}{4}$  and 12 are left and he adds 4 of water. He then drinks  $\frac{1}{2}$  of wine and there are 9 kuḍavas left and the water is made up to 7 kuḍavas. Then he consumes  $\frac{2}{3} = 2\frac{1}{3}$  of wine and there are  $9 - 2\frac{1}{3} = 7 - \frac{1}{3}$  and the water is made up to  $9\frac{1}{3}$ . He then drinks  $\frac{61}{4} = 3\frac{3}{4}$  and there is left  $6\frac{1}{3} - 3\frac{3}{4} = \frac{5}{12}$  and the water is made up to  $1\frac{1}{12}$ . There is, therefore, finally  $\frac{5}{12} = 5\frac{1}{6}$  kuḍavas of wine and  $1\frac{1}{12} = 10\frac{1}{12}$  kuḍavas of water and these added together give 16 kuḍavas. See part I, § 89.

ii. Example.—Having given one-quarter as toll at four toll-houses eight of saffron is brought in. State, O Pandit, what is left.

Solution.  $8 \times \frac{1}{4} = 2$  and 2 is paid in toll;  $6 (1 - \frac{1}{4}) = 4\frac{1}{2}$  and the loss is  $1\frac{1}{2}$ ;  $4\frac{1}{2} (1 - \frac{1}{4}) = 3\frac{3}{4}$  and the toll is  $1\frac{1}{2}$ ;  $3\frac{3}{4} (1 - \frac{1}{4}) = 2\frac{7}{8}$  and the last toll is  $\frac{7}{8}$ ; and the total toll paid is  $2 + 1\frac{1}{2} + 1\frac{1}{2} + \frac{7}{8} = 5\frac{5}{8}$  which leaves  $8 - 5\frac{5}{8} = 2\frac{3}{8} = \frac{19}{8}$ .

Continued on fol. 13 recto.

10	5	5	5	guṇitam jātam	1250
1	4	4	4		64

G 4. [13 recto.] i. Here are four 'proofs' of the example given on folio 12 verso.

(a)  $8(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4}) = \frac{3}{4}$ .

(b)  $8 \cdot \frac{3}{4} \cdot \frac{3}{4} \cdot \frac{3}{4} \cdot \frac{3}{4} = \frac{3}{4}$ .

(c)  $8(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4}) = \frac{3}{4}$ .

(d)  $x^4 = \frac{81}{32}(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})(1-\frac{1}{4})$ , whence  $x^4 = 8$ .

ii. Example.—There is a quantity of molasses weighing eight bhāraṅkas. What will be left after giving away one-third, one-sixth and one-fifth?

$8 \cdot \frac{3}{4} \cdot \frac{2}{3} \cdot \frac{4}{5} = \frac{3}{4}$  and this is the answer.

iii. Example.—By a gain of five-fourths ten droṇas are obtained. Let it be said, O best of calculators, what will be the gain by three transactions.

(Here the term lābha seems to have meaning 'capital + profit,' what is termed the 'mixed quantity' mīśraṅka on folio 62.)

$10 \cdot \frac{5}{4} \cdot \frac{5}{4} \cdot \frac{5}{4} = \frac{1250}{64} = 19\frac{17}{64} = 19 \text{ dro}^\circ + 2 \text{ ād}^\circ + 0 \text{ pra}^\circ + 2 \text{ ku}^\circ$

For these measures see part I, §109.

Continued on the reverse.

 phalam 16 kshayaṁ 24 evaṁ 40 ||

ii. udā° || guḍa piṇḍa jñāta tulyoś chatu . . . avye guḍam |

tri-chatu φ - pañcha-shaḍ vṛiddhyā chatvāriṁśa (bha\*) ve kshaya .

G 5. [14 recto.] i. The find order of folio 14 is unknown. It introduces a variation of the problems given on folios 10 to 13, but it still quotes from the same sūtra or a very similar one. The first example can be represented by  $x(1-\frac{1}{3})(1-\frac{1}{4})(1-\frac{1}{5})=x-24$ .

Solution:  $\frac{2}{3} \cdot \frac{3}{4} \cdot \frac{4}{5} = \frac{2}{5}$ ,  $1 - \frac{2}{5} = \frac{3}{5}$ ,  $\frac{3}{5} \cdot 40 = 24$  and this is the quantity (piṇḍam).

Proof:  $\frac{2}{5}$  of 40 = 16 and 40 - 16 = 24.

Another proof of this:  $40(1-\frac{1}{3})(1-\frac{1}{4})(1-\frac{1}{5}) = 16$  and 40 - 16 = 24.

ii. Example.—A known amount of molasses equal to . . . four is increased by one-third, one-fourth, one-fifth, one-sixth and then forty is lost . . .

No solution is preserved.

i. udā° || ajñātārambha-lohasya tri-chatu φ - pañchakā kshaye |

3	4	5		1

14 verso.

G 5. [14 verso.] (i) Example.—An unknown quantity of lapis-lazuli loses one-third, one-fourth, and one-fifth; and the remainder after the three-fold operation on the original quantity is twenty-seven. State what the total was, O wise one, and also tell me the loss.

Solution  $\frac{2}{3} \cdot \frac{3}{4} \cdot \frac{4}{5} = \frac{2}{5}$ ;  $1 - \frac{2}{5} = \frac{3}{5}$ ;  $27 \div \frac{3}{5} = 45$  and 45 - 27 = 18 and this is the loss.

The meaning of ambha-loha = lapis-lazuli was suggested by Dr. Hoernle.

karaṇaṁ :|| dhāntaśo ghātitaṁ tena | †rūpa kshayaṁ kritvā† jātaṁ

G 6. [15 verso.] There is a suspicion that this is a double leaf. The lenticels on the left side are well-marked but hardly any trace of them appears on the right side. Also the contents are to some extent incongruous.

The example may be represented by  $x(1-\frac{1}{3})(1-\frac{1}{3})(1-\frac{1}{3})(1-\frac{1}{3})=16$ . Now  $\frac{2}{3} \cdot \frac{2}{3} \cdot \frac{2}{3} \cdot \frac{2}{3} = \frac{16}{81}$  and  $16 \div \frac{16}{81} = 81$  and this is the original quantity.

Another method by *kala-savarna*. (This term laterally means 'parts resembling one-sixteenth,' but by Mahāvira it is used to denote fractions generally iii. 1). The question is inverted: 'Of iron (refined) four times eighty-one is given. What is the remainder, state, O expert, which is solved by working hard in calculating.'

$81(1-\frac{1}{3})(1-\frac{1}{3})(1-\frac{1}{3})(1-\frac{1}{3})=16$ .

"Another proof is made and the original amount is not known."

$$x^4 = \frac{16}{(1-\frac{1}{3})(1-\frac{1}{3})(1-\frac{1}{3})(1-\frac{1}{3})} = 81 \text{ pala.}$$

dhāntaso . . . . . iti | kṛitvā

- G 7. [16 recto.] i. The find order is 30 and the writing is α2,4. Only the remnants of a problem: Loss on  $1\frac{1}{2}$  is  $7/6$ ; what is the original when the remainder is 10? Loss on 1 is  $\frac{7}{6} \div 1\frac{1}{2} = \frac{7}{9}$  therefore  $x \cdot \frac{7}{9} = 10$  and  $x = \frac{90}{7} = 12\frac{6}{7}$ .  
 Proof by the rule of three:  $\therefore 1\frac{1}{2} : : 10 : 12\frac{6}{7}$ .  
 ii. Example.—Of a *ghaṭakā* of honey two-thirds is given, to the second two-fifths, to the third two-sevenths, to the fourth two-ninths, till only three *palas* (are left). O Pandit, state how much altogether was taken away by the tax collector.

## H 1.

sūtram . . . . .

16 verso.

- i. idāni suvarṇa kshayaṁ vakshyāmi . . syedaṁ
- ii. sūtram || kshayaṁ saṁguṇya kanakās tadyutir bhājayet tataḥ  
saṁyutair eva kanakair ekaikasya kshayo hi saḥ

| 1 | 4 | 9 | 16 | ... | esha yuti | 30 | kanakā yuti 10 anena  
bhaktvā labdham . . . . .

- H 1. [16 verso.] i. The end of a sūtra is marked but the number is not preserved (probably 26) and then a new section is introduced by the remark—"Now I shall speak about suvarṇa kshaya." It should be noted that Mahāvira uses the term kshaya as synonymous with varṇa in his section (vi, 169ff) on suvarṇa kṣīṭikāra. In our text there seems to be some confusion about the meaning of kshaya which here really means varṇa or 'quality,' although the author obviously thought it denoted a loss. Mahāvira's rule is—

Kanaka kshaya saṁvargo mitrasvarṇāhṛitaḥ kshaya jñeyah |

paravarṇa pravibhaktāni suvarṇa guṇitāni phalaṁ hemnaḥ || 169 ||

"It should be known that the products of gold kshaya, when divided by the mixed gold gives rise to the kshaya. When divided by the last varṇa (=kshaya) and multiplied by the gold gives the corresponding quantity of gold."

ii. Rule.—Having multiplied the parts of gold with the kshaya let this sum be divided by the sum of the parts of gold. The result is the average kshaya. This means  $f = \frac{f_1 g_1 + f_2 g_2 + \dots + f_n g_n}{g_1 + g_2 + \dots + g_n}$  where f denotes kshaya and g gold.

iii. Example.— $f_1=1, f_2=2, f_3=3, f_4=4$  and  $g_1=1, g_2=2, g_3=3, g_4=4$  therefore  $f = \frac{1.1+2.2+3.3+4.4}{1+2+3+4} = \frac{30}{10} = 3$ .

Continued on fol. 17 recto.

evam sarveshām pratyayam

H 2. [17 verso.] I do not understand the problem but it is explained by Dr. Hoernle in the *Indian Antiquary* of 1888 (Vol. XVII, p. 43).

The solution is  $F = \frac{5.4+6.5+7.6+8.7+9.8+10.9+2.1+3.2+4.3}{5+6+7+8+9+10} = \frac{330}{45} = 7\frac{1}{3}$ .

Proof by the rule of three— 45 : 330 :: 1 :  $7\frac{1}{3}$  and 'so for all of them.'

\* Inadvertently omitted in the manuscript.

## H 3.

6

sthāpanam | 1 53 . | phalam ā 17 tri . 2

J 3. Folio 41 is much damaged and the illustration (Plate xxviii) suggests a double leaf ; but the illustration is deceptive, for the cause of the uneven colour is the presence of gum on the original leaf. The find order is unknown : writing α4.  
[41 recto.] This is undoubtedly closely connected with fol. 65 recto and the repair of fol. 41 and the separation of the two parts of fol. 65 would possibly make both intelligible.  
[41 verso.] Not understood. \*Possibly the 8 and 6 are change-ratios.

## K

i. *udā°* || ko rāsi pañcha yutā mūladaḥ sā rāśis sapta hīna

*pañchāśama sūtram* 50

ii. *sūtram* | gavāṃ viśesha kartavyaṃ dhanam chaiva puna . .

. . . . .

K [59]. The find order is unknown but the *sūtra* number is 50 and it probably originally preceded fol. 60. The reverse is blank, which possibly means that there are portions of two leaves stuck together.

(i) *Example*.—What number with five added is a square and that same number with seven subtracted also being a square? What is that number? is the question.

Statement  $x+5=s^2$ ,  $x-7=t^2$ .

Solution  $\langle x=[\frac{1}{2}(\frac{5+7}{2}-2)]^2+7=11$  by steps thus> : having combined the added and subtracted numbers  $5+7=12$  : that halved  $=6$  ; two subtracted 4 ; halved 2 ; squared 4 ; then the subtractive number (7) is to be added and by the addition of this  $4+7=11$  and this is the required quantity.

Proof:  $11+5=4^2$ ,  $11-7=2^2$ . See Part I, §81.

(ii) There appears to be a reference to this fragment on fol. 60 *recto* where *sūtra* 51 is closed.

2

[60.] Writing α2. Notice the 'sickle' i. Find order unknown. Connected with fol. 59 on one side and folios 61—63 on the other. Folios 60—63 form a fairly definite section (L) relating to earning and spending.

[60 recto.] (i) This fragment is connected with the sūtra at the bottom of fol. 59, but very vaguely.

(ii) Rule.—The known quantity is divided by the difference between the expenditure and earning. This result is the time ....

This means  $t = \frac{6}{1-6}$

(iii) Example.—In two days one earns five ; in three days he consumes nine. His store is thirty. In what time will his earnings be consumed ?

Solution :  $t = \frac{30}{\frac{9}{3} - \frac{5}{2}} = <60$  and the amount earned in this time is  $\frac{2}{3}$  of 60 = 150 dinaras.>

. . . . . bodi | phalam 180 | dvāpañchāsama sūtram 52 || 60 verso.

sūtram | aha dravya harāsauta tad viśesham vibhājayet  
yal-labdham dviguṇam kālam° dattā sama-dhanā prati ||

[60 verso.] (i) Remnant of proof of the example on the obverse. The complete proof probably was :—

2 days : 5 dināra : : 60 days : 150 dināra

3 days : 9 dināra : : 60 days : 180 dināra

and 180—150=30.

(ii) Rule.—(If one earns  $e_1$  in  $d_1$  days and another  $e_2$  in  $d_2$  days and the first gives  $g$  to the second then  $\frac{e_1}{d_1}t - g = \frac{e_2}{d_2}t + g$  and)  $t =$

$$\frac{2g}{\frac{e_1}{d_1} - \frac{e_2}{d_2}}$$

## L 1—contd.

5	rū	6	.	.	.	.
3	di	5	.	.	.	.

See *Indian Antiquary*, XLII (1888), pp. 41, 44 ; but in 1915 Dr. Hoernle sent me the following note :—" The textual difficulty was not fully understood by me : the text is badly corrupted ; a portion (the 2nd *pāda*) has dropped out, and another (the 1st *pāda*) has been mixed up with the commentary. The real text of the first *pāda* is quoted in obverse line 8 of the next folio, in the commentary of the second example of the *sūtra*, and the missing part of the second *pāda* must be supplied from obverse lb. 4 and 5 of *sūtra* 52 ; which is merely a variant of *sūtra* 53. The latter *sūtra* should really run as follows :—

ahadravya viśeṣaṁ cha vibhajya datta samguṇaṁ |  
yal-labdhāṁ dviguṇaṁ kālāṁ dattā sama-dhanā prati ||

i.e., " the difference of the daily earnings, having divided (invested), is multiplied with the given amount : the result being doubled is the time ; the given amount goes towards making the possessions equal."

(iii) *Example*.—In three days one pandit earns a wage of five and a second wise man earns six (*rasa*) in five days. The second is given by the first seven from his store and by this giving their possessions become equal. Let it be stated in what time.

Solution :  $t = \frac{2 \times 7}{5/3 - 1} = 30$ .

## L 2.

2	3	1	

karanam | †vi . . . . .

L 2. [61 verso.] i. Proof of example on the obverse—

$$1 : \frac{13}{6} :: 30 : 65$$

$$1 : \frac{3}{2} :: 30 : 45 \text{ and } 65 - 10 = 45 + 10.$$

ii. The rule means  $C = \frac{p}{c/s - 1}$  where C is the capital, p the profit, c the rate of purchase and s the rate of sale.

iii. *Example.*—One buys 7 for 2 and sells 6 for 3 and 18 is his profit. What was his capital?

Solution.— $C = \frac{18}{\frac{1}{2} - \frac{1}{3}} = 24$ . The proof is given on folio 62 recto.

## L 3.

. . . . . bhājaye chaiva 

1
6

 . . . . .

L 4. [63 *recto*.] i. Proof of example given on folio 62 *verso*.

8 : 3 :: 240 : 90 and 6 : 4 :: 240 : 160 and 160 = 90 + 70.

ii. The rule means  $C = \frac{1}{1-\frac{c}{s}}$  where  $l$  is the loss sustained, i.e., having investigated the selling rate multiply with the purchase rate and having subtracted from unity divide—and the capital is obtained.

iii. *Example.*—With five four-squared are obtained by some man. For one six are sold and fifty-six is the loss. Calculating purchase and sale let his capital be stated.

The solution is  $<C = \frac{16}{1-\frac{5}{6}} = 120$  and the number of articles is  $\frac{1}{5}$  of  $120 = 364>$ .

## L 4—contd.

L 4. [63 verso.] Proof of example on the obverse :  $\langle \frac{1}{6} : 1 :: 384 : 120 \rangle$ , then with the selling rate  $6 : 1 : 384 : 64$  and  $120 - 64 = 56$ .   
 ii. Rule.—That which is the tax on cloth is taken in cloth : by the method of the rule of three tax and sale alike.   
 iii. The example is not understood but reads something like this : The tax on a piece of cloth is one-twentieth part. Some one sells three-hundred. On the pieces being brought to market, two pieces are taken by way of tax : ten is (?) the selling price. What is the value ?

M 5.

[34 recto.] i. The problem is : Eleven birds feed on a *prasṛiti* (handful) of corn; how many can feed on 8 Kharis of corn? It ends "Say, O friend, say what are the *Khagas*, O SUNDARĪ."

If this is correct, the name Sundarī, 'beautiful one,' is used in exactly the same way as Līlāvati is used by Bhāskara.

The solution is 1 *pra*° : 11 *kha*° :: 8 *khā*° : 63,360 *khagas* which would make 720 *prasṛiti*=1 *khāri*; but there are many elements of doubt and the application of *esha bāhu pramāṇaṁ* to this particular problem is not clear.

ii. By certain persons one *kalā* plus one *pāda* and one *yava* are given in gold daily at the shrine of ŚULIN. What would be the amount of the gift in five years, five months and fifteen days.....I desire to know that.

Solution.—1 day : 1 *ya* + 1 *ka* + 1 *pa* :: 5 y. 5 m. 15 d. : x <or 1 d. : 30 *pa*° :: 1,965 d. :  $\frac{1965 \times 30}{102 \times 25}$  *tola* = 12 *to*° + 3 *dhā*° + 1½ *am*° >  
See Part I, § 111.

ku° 1	chhe° 128*	mā°-ku° 1	mā°	chhe 40*	si°-mā°	sa° 55
1	1	2				1
2						

[34 verso.] i. The fragment *chitritāṁgai* .... *ārjunena griddhra* is extremely interesting although it throws no light on the problem. See Part I, § 47.

The statement is puzzling : it may mean

$$\frac{1}{2} + \frac{1}{8.9} + \frac{1}{8.9.5} : 1 \text{ sa} :: 777 \text{ yo}^\circ + 222\frac{1}{2} \text{ kro}^\circ : \dots 40$$

But all the terms except the second are ambiguous.

ii. The problem is about a diamond weighing 1½ *māśaka*, and obtained for ? 55 *satera*.

The statement means 1½ *ku*° + ½ *mā*° : 55 *sa*°, and indicates that 128 *mā*° = 1 *ku*° and that 40 *si*° = 1 *mā*°. See Part I, § 111.

The whole page is an interesting puzzle. (Is the leaf a double one ? Neither side shows any clear lenticle.)

## M 6.

i. . . . . sūrya māṇasya

37 recto.

divākarasya ghaṭikaiḥ kim prayātasya vada . niśchitaṁ .

$$\left\| \begin{array}{c} 30 \text{ mu}^\circ \text{ chhe}^\circ 2^* \text{ gha}^\circ\text{-mu}^\circ \\ 1 \qquad \qquad 1 \end{array} \right\| \begin{array}{c} 500,000,000 \\ 1 \end{array} \left\| \begin{array}{c} \text{gha}^\circ 1 \\ 1 \end{array} \right\| \text{pha}^\circ \text{yo}^\circ 83.333333\frac{1}{3}$$

ii. bhāṇo ratham sūra mahoraga siddhasam(g)hai vidyādharaḥ φ parivritaṁ . . .

M 6. [37 recto.] i. The question may be roughly restored : The Sun (sūrya) traverses 500,000,000 *yojanas* in a day. State with certainty the amount of the journey of the sun (Divākara) in a *ghaṭikā*.

The statement means  $30 \text{ mu}^\circ : 500,000,000 : 1 \text{ gha}^\circ : 83,333,333\frac{1}{3} \text{ yo}^\circ$  and it indicates that  $2 \text{ ghaṭika} = 1 \text{ muhūrta} (= \frac{1}{30} \text{ of a day})$ . The origin of the length of the daily journey of the sun, namely 500,000,000 *yojanas*, is not known. See Part I, § 100.

ii. The chariot of the sun (BHĀNU) is surrounded by the groups of gods, great snakes, SIDDHAS and VIDYĀDHARAS. In a day and night its journey is said to be half a hundred *koṭis*. Tell me, O best of calculators, how much in one *muhūrta* ?

$$30 \text{ mu}^\circ : 500,000,000 :: 2 \text{ gha}^\circ : 16,666,666\frac{2}{3} \text{ yo}^\circ.$$

iii. udā° || rāja yudhisthīro nāma φ pāṇḍu-vaṁśa . . . . .

[57 verso.] i. The remnant of a problem possibly related to the daily motion of Jupiter, which according to the *Sūrya Siddhānta*, amounted to very nearly 5 minutes of arc (*liptā*).

ii. If BHĀNUJA (Saturn) moves through a sign in two and a half years, state, O knower of the truth, what will its motion in a solar day be equal to.

The solution is  $2\frac{1}{2} \text{ years} : 1 \text{ sign} :: 1 \text{ degree} : x$   
and  $x = \frac{1 \text{ sign} \times \frac{1}{2} \text{ degrees}}{2\frac{1}{2} \text{ years}} = \frac{30 \times 60 \times 60 \times 2}{5 \times 360} = \frac{108,000}{900} = 120'' = 2 \text{ minutes of arc}$  (not 2 seconds as stated in the text, where *viliptā* appears to have been written by mistake for *liptā*). The terms employed are all orthodox except perhaps *vāsara* for 'solar day', but its special use is quite intelligible.

See Part I, § 100 ; and also my *Hindu Astronomy*, p. 57.

iii. This fragment is of interest because of the reference to YUDHISTHIRA. See Part I, § 48.

## M 7.

i. . . . . vyūha pārthan̄ hehayakī . . . . . ghnata

		1				
		4				
		1				
		2				

anyā . . . . . i pramāṇam

ii. sūtram || eko ratho gaja . . . . .

M 7. [47 recto.] i. This appears to relate to Pārtha the Mahābhārata hero, who pierced each soldier with 16  $(1+\frac{1}{2})$   $(1+\frac{1}{2})$  arrows and slew four divisions of the army. How many arrows did he use?

$$1 \text{ śi}^\circ : 16 \text{ (1+\frac{1}{2}) (1+\frac{1}{2})} :: 4 \times 21,870 : 2,624,400.$$

The abbreviation śi°=ī ; a°=anikinī. See Part I, § 52.

There is a very similar example about Pārtha in the *Līlāvatī* (§ 67) which has already been quoted (Part I, § 47).

ii. Rule.—There is little doubt that this rule relates to the constitution of an army and is exemplified on the reverse (fol. 47 recto.)

i. . . . .

47 recto,

. . . . . vichakṣaṇaḥ

chamūs tu pritanās tisras tisraś cha . . . . .

anikinī daśaguṇām āhu arakṣhohanī buddaḥ ||

[47 recto.] i. Apparently 3 chamūs=1 pritanā, 3 pritanās=1 anikinī and 10 anikinīs=1 akṣhauhiṇī. The statement mean: a patti consists of 1 ratha+1 gaja+5 nara+3 turaga (i.e., 1 chariot+1 elephant+5 foot soldiers+3 horsemen) and that an akṣhauhiṇī contains 3.710 of each of these, namely—

3.710.1	chariots	=21,870	chariots.
3.710.1	elephants	=21,870	elephants.
3.710.5	foot-men	=109,350	foot-men.
3.710.3	horsemen	=65,610	horsemen.
TOTAL		=218,700.	

Albīrūnī (Chap. xlviii) gives the following scheme:—

Each akṣhauhiṇī has 10 anikinī.

anikinī	3	chamū.
chamū	3	pritanā.
pritanā	3	vāhinī.
vāhinī	3	gaṇa.
gaṇa	3	gulma.
gulma	3	senāmukha.
senāmukha	3	patti.
patti	1	ratha

and “a ratha comprehends besides, one elephant, three riders and five footmen.”

Possibly all these terms were included in the example but vāhinī, gaṇa, gulma and senāmukha are now missing. Numerically Albīrūnī's scheme is identical with that given in our text.

The abbreviation tu° in the text is probably for turaga ‘a horse.’

See Part I, §§ 51 and 94.

## M 7—contd.

bhāṇḍā 700  
1

vyaya rāśi	223	āya rāśi	280	etat kāleṇa ārjana bhaksh
	144		61	

M 11. [44 verso.] ..... the capital is seven hundred. What is the time of the consumption of the earnings.

The statement means—

Daily earning  $\frac{1}{144}$ ; given for Bha(vāni) 8 in  $5\frac{1}{2}$  days; given for pa(ra-loka) 1 in 32; given for Śū(lin)  $\frac{21}{4 \times 36}$ ;  $\frac{1}{84}$  years; reserve 700.

<The daily earning is  $\frac{1}{144}$ >. The expenditure quantity is  $<\frac{8}{5\frac{1}{2}} + \frac{1}{32} + \frac{21}{4 \times 36}> = \frac{321}{144}$ . <The daily loss is  $\frac{333-162}{144} = \frac{171}{144}$  so 700 will last  $\frac{700}{\frac{171}{144}} = \frac{98400}{171} = 575\frac{1}{3}$  years and 'in this time the earning will be consumed.'

Then 1 day :  $\frac{321}{144} :: \frac{3}{84} \times 360 : 2559\frac{1}{3}$  and this is the (total) expenditure in  $\frac{3}{84}$  = 4 years, 7 months,  $2\frac{1}{3}$  days.

Then the income,  $1\frac{1}{2}$  days :  $1\frac{1}{2} :: \frac{3}{84} \times 360 : 1859\frac{1}{3}$ , and  $2559\frac{1}{3} - 1859\frac{1}{3} = 700$ .

[44 recto. 1. Again  $\frac{280}{61} : 2559_{61} :: \frac{1}{360} : \frac{28}{61}$ . This is the expenditure measure. See Part I, § 96.

Example.—One produces ten and a half in two and one-third days. For the sake of religion he gives thirteen and one-third in three and one-eighth days; he offers for VĀSUDEVA one quarter less than thirteen in eight and a half days. Desiring reward in a future world he gave to Brāhmins for food one and one-third in three and one-fifth days . . . . . two and a quarter in five days . . . . .

## M 12.

M 12. [43 recto.] and also twelve and a half in thirty-three and one-third days for the best wine for the consumption of merchants. In the treasure house was stored twelve hundred. Say, O Pandit, how long can this expenditure continue.

The statement means :—

$$\text{Daily income} = \frac{10\frac{1}{2}}{2\frac{1}{2}} = 9.$$

$$\text{Daily expenditure} = \frac{13\frac{1}{2}}{3\frac{1}{2}} + \frac{13\frac{1}{2}}{6\frac{1}{2}} + \frac{1\frac{1}{2}}{3\frac{1}{2}} + \frac{1}{1\frac{1}{2}} + \frac{1}{6\frac{1}{2}} + \frac{2\frac{1}{2}}{5} + \frac{12\frac{1}{2}}{33\frac{1}{2}} = \frac{1807}{240}.$$

<The daily loss is therefore  $\frac{1807}{240} - 9 = \frac{727}{240}$  and  $\frac{1200}{727 \div 240} \times \frac{1}{1\frac{1}{2}} = \frac{800}{727}$  is the period>.

2	10	800	adha-chchhedam 360 diva . . teṇa saha    ya-piṇḍam	43 verso.
1	1	727		
3	2			

2982	adhunā vyaya piṇḍam	di° 1	1807	800

ūrdha-chchhedam 360 phalam diva	2982	puna	800	2982	1
	486		727	486	1
	727			727	

adha-chchhedam 360 di . . phalam pratidina . . .	1807	evam sarva
	240	

trai-rāsikena | udā°

[43 verso.] Proofs.— $2\frac{1}{2} : 10\frac{1}{2} :: \frac{800}{727} \times 360 : 1782\frac{1}{2}$  the total amount earned and  $1782\frac{1}{2} + 1200 = 2982\frac{1}{2}$ .

Again  $1 : \frac{1807}{240} :: \frac{800}{727} \times 360 : 2982\frac{1}{2}$ ; and lastly  $\frac{800}{727} : 2982\frac{1}{2} :: \frac{1}{1\frac{1}{2}} : \frac{1807}{240}$  the daily expenditure. Thus each item (can be tested) by the rule of three.

## M. 13.

ārdha yukte trayo-daśa sārdham bhavati

42 recto,

40 bhā°	160	13	. . . . .	eshām chchhedām kṛitā jātā ekeṇa . . .
1	1	1		
		2		

. . . sārdha trayo-daśabhi kim iti	1	4	27	pha° 54 eshām . .
	1	1	2	

. ekena labdha chatvārish śaḍbhi saṁpadyate katham	1	. . . . .	4
	1		

. . eko labhati chatvāri śaṁsardhasya tu kim bhavet . . . . .

. . . . .

M 13. [42 recto.] This contains portions of a solution that is not, at present, fully understood. The preliminary work is missing and then comes the following proportion  $40 : 160 :: 13\frac{1}{2} : 54$ , or cancelling by 40 we get  $1 : 4 :: \frac{3}{2} : 54$ . The next part is missing but apparently was—

$$1 : 4 :: 6 : 24$$

$$1 : 4 :: 3 : 12$$

$$1 : 4 :: \frac{3}{2} : 18$$

. . . . .

i. jātā 54 | śaḍbhi 24 | . . 12 | ardhā 18 | ekatraṁ 54 ||

42 verso,

10 || esha vimśānām diva . . bhavati | atra uparimāś khandhakasya esha guṇākāram bhavati | . . . . .

[42 verso.] i. A fragment:  $24 + 12 + (24 + 12) \div 2 = 54$ . . . . . This sūtrā gives the three term solution with respect to one price.

ii. I shall instance another. . . . . what is that which is written in the first term? The solution is a matter of intelligence.  $20 \times 1\frac{1}{2} \times \frac{1}{3} = 20 \times \frac{3}{2} \times \frac{1}{3} = 20 \times \frac{1}{2} \times 1 = 10$ . . . . . Now this is the calculation of the foremost term.

## M 14.

*bhājaye labdha paṇyaṁ*

M 14.

[50 verso.] i. The solution is 1 *dramma* : 100 *trapusā* ::  $\frac{1}{2}$  : 50.ii—iii. The problem is too mutilated to understand. The *sūtra* seems to apply to the problem, but it is not clear.

. . . . . vaśishta putra

yach . . . .

[50 recto.] At the top of this page is the remnant of a problem, too broken up to make out. The rest of the page is devoted to what appears to be a colophon. This is not all clear but what remains seems to state that the work was written by a certain Brāhmaṇa, a prince of calculators, the son of Chhajaka. It also refers to the importance of the science of calculation, which, it is said, we owe to Śiva.
